

ENEE452 HW08 : I2C peripheral device driver

You should have have received an email for which the name of the email's recipient is the part ID of one of the I2C-interfaced peripherals on ENEE452's B-L475-IOT1A project board.

Problem 1: peekDVC() and pokeDVC()

For the DVC you have been assigned, write drivers which implement the functions described below for use in the freeRTOS environment, replacing 'DVC' with your assigned part's ID:

```
int setupDVC();  
int peekDVC(adr,&data);  
int pokeDVC(adr,&data);
```

If your DVC has block-transfer modes, implement them as

```
int peekmultiDVC(adr,&data,count);  
int pokemultiDVC(adr,&data,count);
```

Each of your drivers should be tested on the board with some provable transaction such as peeking the device signature, poking and then peeking some volatile register, etc.
